

1    Amendment to the Abstract

2       An Internet based method for ordering and supplying selected coded labels to be  
3 applied to a variety of fruits and vegetables at a plurality of labelling sites is provided. The  
4 supply of different coded labels at each labelling site is continuously and automatically  
5 inventoried. The inventorying is facilitated by the use of a data tag carried by the core on  
6 which a label strip is wound, the data tag including data sufficient to uniquely identify the  
7 labels carried by that core including the specific label identity identify and quantity. The label  
8 inventory for each of the labelling sites is stored. Approved customers or representatives may  
9 access the stored inventory data and display the data on a computer monitor and may order  
10 additional selected labels for one or more of the labelling sites.
